

App Creators Presents:
Cyrus - Your Personal Voice Assistant

Inspiration

- We were inspired by different voice assistants like Google Assistant, Siri, Alexa, Bixby etc.
- We tested a lot of virtual assistants and found a few flaws in them.
- Some had poorly designed user interfaces, some were not easy to use and some lacked important features.
- Inspired by these problems we decided to come up with Cyrus.

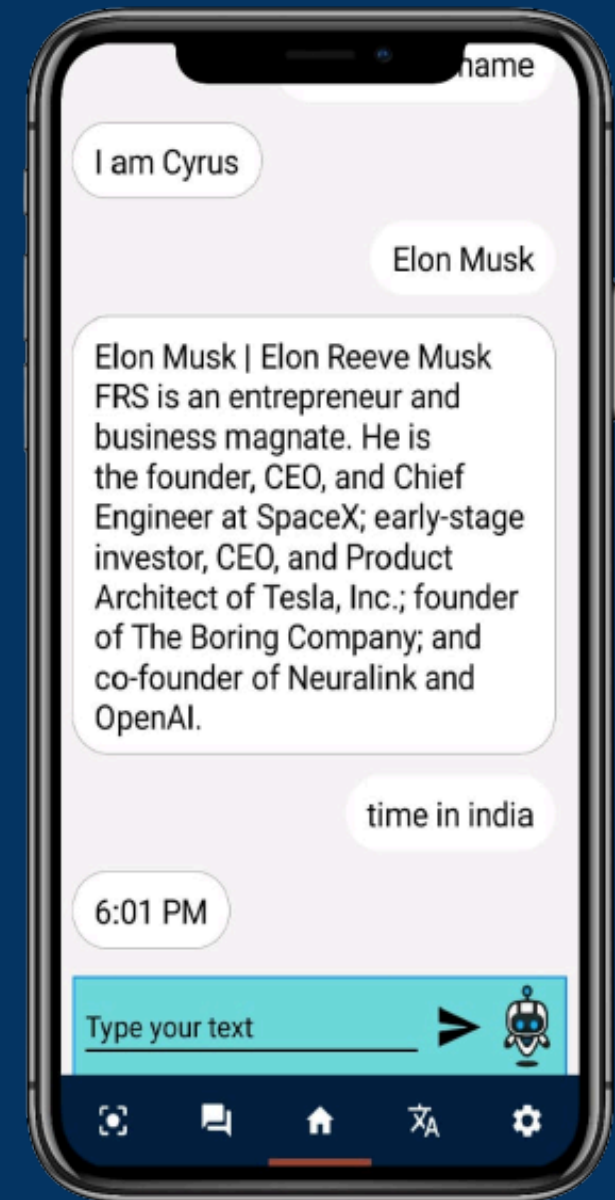

User research and app ideas

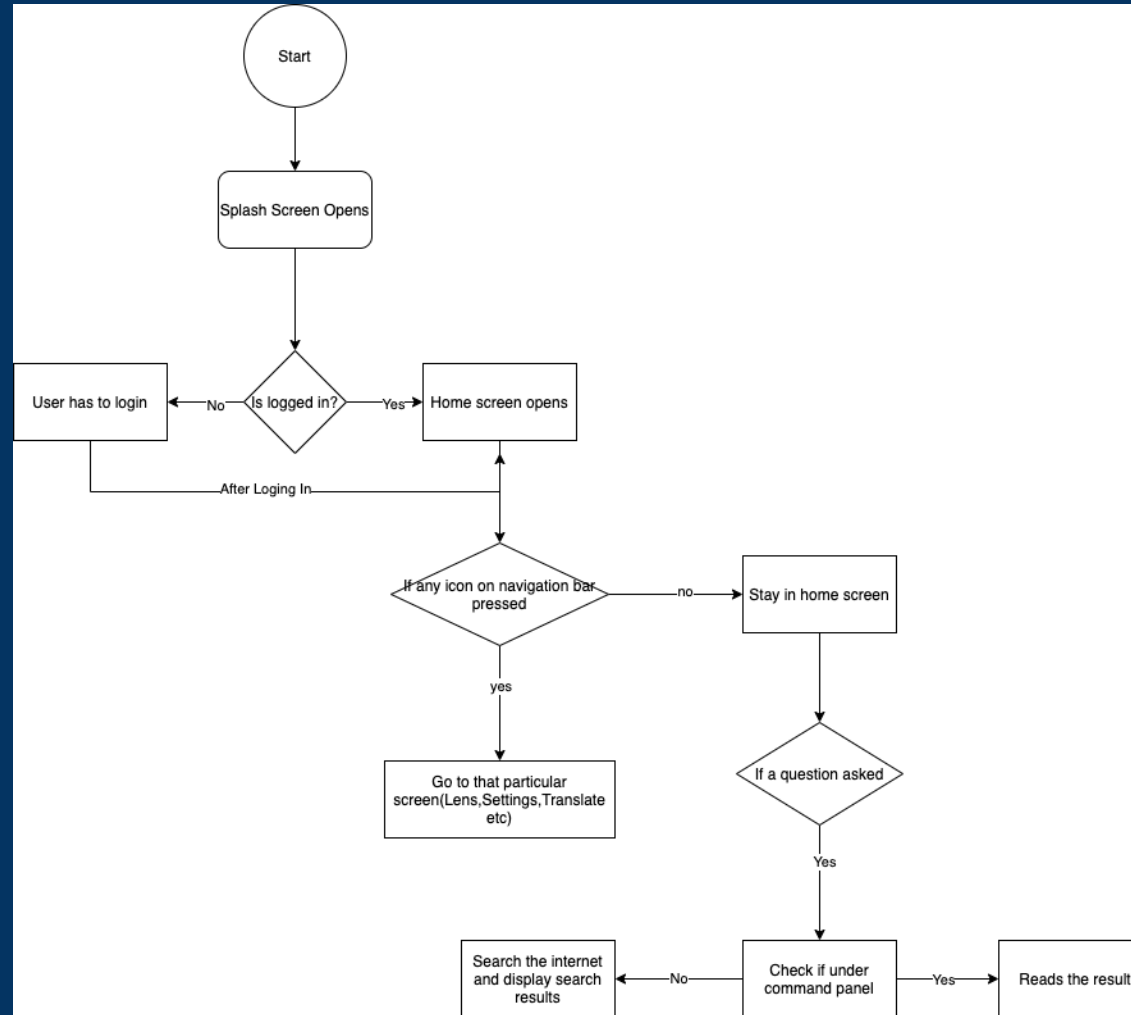

- Before creating Cyrus, we did our research on what all features current assistants lack.
- We also surveyed people through online mediums.
- A problem we found out was that, voice assistants had limited features and users had to install third party applications to accomplish basic tasks.
- Due to the long process of installing different apps, people tend to avoid using voice assistants.
- Our idea was to incorporate all the basic features into a single app which was easy to use, fast, had a user friendly UI and actually served its purpose.
- Ideas like scanning text from a document, translating a text, setting reminders, taking notes and much more were taken into consideration.

Creative/Unique Features

- One unique feature Cyrus has is capturing text from an image.
- It can also translate any text to over 60 languages.
- A feature which makes Cyrus stand out is its inbuilt command panel. This allows users to set custom commands(For eg: I can set my brothers name is Anand and the next time I ask Cyrus what my brothers name is, it will reply with Anand). Each users commands will be saved in a database and can be accessed by the user on any device by simply logging in to their account.
- It also has screens from where the user can take notes, set reminders or contact us.

Flow of the app

Thank you!
